

AI Solutions Portfolio

Solving business problems through AI, automation and intelligent workflows.

SUMMARY

Five AI tools, each fixing a real, everyday business problem

AI is used to remove slow, repetitive work, not to replace judgement. Every tool keeps a **human-in-the-loop** (a person reviews and approves the output before it is used)

METHODOLOGY

My Approach

A consistent methodology applied to every solution.

Automatically tracking what competitors are doing

THE PROBLEM

Multiple comparison websites contained 10–15 brands per page, each supported by detailed long-form reviews. Keeping hundreds of reviews competitive required continuous manual research across competitor websites, making the process slow, inconsistent and difficult to scale.

WHAT WE BUILT

Built an AI platform that crawled competitor websites, extracted products, pricing, messaging, UX/UI, trust signals and positioning, then compared them against our own sites. The platform generated structured reports with strengths, weaknesses, content gaps, feature ideas, payment methods, UX improvements and strategic recommendations.

Days of Manual Work → Minutes, Automatically

HOW IT WORKS

Generate executive report

Crawls comparison sites, compares against our own, and drafts the report

Run analysis

PIPELINE

CAPABILITIES

Automated web crawling
Scans comparison sites at scale

Product & pricing extraction
Products, pricing and payment methods

Messaging & positioning
Reads how competitors position themselves

UX / UI comparison
Benchmarks design and experience

Trust signal detection
Identifies credibility indicators

Structured reporting
Turns findings into recommendations

EXECUTIVE REPORT PREVIEW

Q3 competitive intelligence report
Last generated 3 days ago · 12 sites analysed

Strengths identified	6
Weaknesses identified	4
Content gaps	9
Feature ideas	5
Payment methods compared	3
Strategic recommendations	7

Keeping hundreds of reviews accurate, automatically

THE PROBLEM

We publish hundreds of long articles reviewing different brands, and need to keep checking they are still accurate. Doing this by hand was slow and easy to fall behind on.

WHAT WE BUILT

Built a tool that automatically checks our articles against the official brand websites every week and month, then flags anything wrong or out of date, ranked by urgency.

Occasional Manual Checks → Continuous Automatic Monitoring

Cost-Effectiveness

One place to ask any company question

THE PROBLEM

Company knowledge was scattered across 7 different systems, so answering a simple question, or training a new team member, took far longer than it should.

WHAT WE BUILT

Built an AI chatbot (a chat tool you can ask questions to, like a helpful assistant) that instantly answers questions using all our company knowledge in one place.

Knowledge Scattered Everywhere → One Simple Chat

HOW IT WORKS

1. Chat created

2. User request

3. Response generated

4. Continued guidance

Connecting data, content and testing into one system

THE PROBLEM

Our performance data, content planning and testing all lived in separate tools, so no one could easily see why something changed, what to do next, or what had already been learned.

WHAT WE BUILT

Built a platform that brings together performance data, AI-generated content ideas, and automatic testing, so the business can spot problems, react quickly, and remember what has worked before.

Separate, Disconnected Tools → One Connected System

HOW IT WORKS

Data

The performance and content data that powers every tool in the Content, Data, & Intelligence Hub, from what's connected today to what's planned next.

ALREADY POWERING THE HUB

Seasonal & Commercial Calendar

Built-in

Public holidays and curated retail moments across 12 countries, ready to plan content around today.

[Open Seasonal Events ↗](#)

Live Web Search

Built-in

Current market signals for AI Search insights, via Bing and Serper (requires API keys to be configured).

[Open AI Search ↗](#)

PLANNED INTEGRATIONS

These would replace manual reporting with a live performance layer. Requesting one tells us where to focus next.

BI & Visualisation

Power BI, Tableau

See revenue and business performance inside the Hub, without exporting from Power BI or Tableau first.

[Request early access](#)

Web Analytics

Google Analytics, Matomo

Know which pages are winning or losing traffic before you plan next month's content.

[Request early access](#)

Product Analytics

Amplitude, Mixpanel

Spot which features and funnels are actually retaining users, not just getting clicks.

[Request early access](#)

Marketing Analytics

HubSpot, Semrush

See which campaigns are driving qualified leads, and which are just driving traffic.

Experience & UX Intelligence

FullStory, Contentsquare

Catch the friction points, like rage clicks and drop-offs, that are quietly costing conversions.

Experimentation

Optimizely, VWO

Feed every test result straight into the learning memory, so recommendations keep improving.

Turning days of report-building into minutes

THE PROBLEM

Monthly reporting required manually copying data from multiple Excel workbooks into PowerPoint, creating a slow and error-prone process.

WHAT WE BUILT

Designed a platform that analyses PowerPoint templates, maps KPIs to Excel once and automatically generates future reports while preserving layouts. Built with a roadmap for AI commentary, financial projection workflows and data warehouse integration.

Days → Minutes

Ready

What this means for businesses, at a glance.

Every tool turns slow, manual work into something **fast** and **automatic**, with a **human ALWAYS in the loop**.

Competitive Intelligence

Days of Manual Work → **Minutes, Automatically**

Brand Review Governance

Occasional Manual Checks → **Continuous Automatic Monitoring**

Content Buddy

Knowledge Scattered Everywhere → **One Simple Chat**

Content & Data Hub

Separate, Disconnected Tools → **One Connected System**

Monthly Report Automation

Days → **Minutes**
